

ABSTRACT

A latch handle device includes a base has a twist block and a positioning plate installed inside and a handle. One end of the handle formed into a column-shaped
5 connecting post that is inserted inside the base, joined with the positioning plate, and communicating with the twist block. Thereby, the handle and the base are capable of 360-degree rotation in relation to each other before they are installed on a screen door. So, the relative angles between the handle and the base are adjusted to reduce the space required for packaging, thus reduce the packaging
10 measurements and increase loading capacity for transportation.
